

10 Reasons Why SCRAM CAM is an Effective Solution for High-Risk Alcohol Clients

High-risk alcohol clients, or those requiring around-the-clock monitoring, need an effective solution to support their sobriety efforts and help complete the terms of their supervision plan. SCRAM Continuous Alcohol Monitoring[®], or SCRAM CAM[®], is a proven and trusted technology that not only serves as a deterrent to drinking but also helps reduce recidivism, support long-term behavior change, and helps clients contribute as productive members of their families and community. Here are 10 reasons why SCRAM CAM is the most effective solution for high-risk alcohol clients:

1

No Missed Tests

Continuous, automated monitoring eliminates the opportunity to drink around test schedules.

2

Confidence in Test Results

SCRAM CAM conclusively distinguishes drinking from environmental alcohol sources, providing courts with confidence in test results.

3

Rigorous Data Analysis

Drinking and tamper alerts are subject to data analysis conducted by our team of professionally trained analysts and our confirmation criteria is peer-reviewed, validated, and published.

4

Court Admissible and Validated Results

SCRAM CAM test results are single-source admissible, meaning no secondary tests are required to validate results. And, SCRAM Systems has worked with courts and ancillary agencies to provide comprehensive SCRAM CAM testimony through thousands of formal court reports.

5

Court Support

We back our technology in court and provide everything from a written report confirming violation to in-person expert testimony for evidentiary hearings.

6

Anti-Tamper Technology

The SCRAM CAM bracelet is equipped with industry-leading anti-tamper technology that identifies circumvention attempts by even the most savvy client.

7

Supports Long-Term Behavior Change

SCRAM CAM is the only monitoring technology that has been empirically shown to support long-term behavior change—a key to reducing recidivism. Recidivism rates for repeat DWI offenders who wore CAM were 50% less than those who were alternatively sentenced. And, studies show that 9 out of 10 are fully compliant while wearing the device.

8

Optional House Arrest for Increased Supervision During High-Risk Times

With the flip of a switch, officers can add optional RF curfew monitoring to their alcohol testing protocol, providing additional oversight of high-risk clients during high-risk times.

9

More Productive Jail Alternative

High-risk alcohol clients often require intensive, long-term supervision. SCRAM CAM provides a productive and cost-effective alternative to jail. Clients can work on their sobriety while facing real-world challenges and temptations.

10

No Urine or In-Person Testing Needed

Urine (or EtG) testing is costly and involves a delay in processing at a lab, while in-person breath testing only provides a snapshot in time of the client's compliance. And both are time consuming for clients and officers. SCRAM CAM automatically tests for alcohol every 30 minutes, 24/7, without any participation from the wearer.
